New beta tubulin from Acremonium chrysogenum - and relates DNA, vectors and transformed cells, for co-transformations of a wide range of A. chrysogenum strains with foreign genes Claim 4; Page 9-10; 31pp; German.

Vectors based upon the beta tubulin coding sequence may be used to transform Acremonium chrysogenum, optionally in combination with other vectors to introduce a required foreign gene such as the gene encoding glutaryl acylase, an enzyme involved in cephalosporin biosynthesis. The coding sequence may be used to transform a wide variety of Acremonium chrysogenum strains (wild type and mutants). Unlike known systems, it is not recipient-strain limited.                    DNA fragment contg. DNA coding mutant beta-tubulin - originate from Acremonium chrysogenum, used as selective marker for transformation of A.chrysogenum Example 5; Fig 4-6; 16pp; Japanese.

The wild-type coding sequence for beta-tubulin was isolated fr Acremonium chrysogenum ATCC 11550 and sequenced (Q48230). Prim CTU-3 and CTU-6 were used to introduce mutations at codon 100 to 11e) and 167 (Phe to Tyr), respectively. Expression of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Claim 3 and Example 6; Fig 4-6 and Fig 7; 16pp; Japanese. The wild-type coding sequence for beta-tubulin was isolated from Acremonium chrysogenum ATCC 11550 and sequenced (Q48330). Primers CTU-3 and CTU-6 were used to introduce mutations at codon 100 (Asn to Ile) and 167 (Phe to Tyr), respectively. Expression of the mutant proteins encoded by these sequences confers chemical resistance (e.g. to carbendazim and to ansamitocin) on transformed microorganisms. See also Q55406.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                278 GlySerLeuProSerSerAlaLeu
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             GGTTCCCTTCCCTCGTCTGCACTT

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Score

MOL. Gen. Genet. 261:64-70(1999).

-1- FUNCTION: THIS PROTEIN SEEMS TO BE PART OF THE STALK THAT LINKS CF(0) TO CF(1). IT EITHER TRANSMITS CONFORMATIONAL CHANGES FROM CF(0) INTO CF(1) OR IS IMPLICATED IN PROTON CONDUCTION.

-1- SUBUNIT: F-TYPE AIPASES HAVE 2 COMPONENTS, CF(1) - THE CATALYTIC CORE - AND CF(0) - THE MEMBRANE PROTON CHANNEL. CF(1) HAS FIVE SUBUNITS: ALPHA(3), BETA(3), GAMMA(1), DELTA(1), EPSILON(1). CF(0) HAS THREE MAIN SUBUNITS: A, B AND C.

-1- SIMILARITY: BELONGS TO THE ATPASE DELTA CHAIN FAMILY.
